DRILLING COMPLETED AT THE SWIT KIA PROSPECT

Frontier Resources Ltd announces that diamond core drilling was completed late last week at the high grade gold Upper Zone of the Swit Kia Prospect, EL 1595 – Bulago in Papua New Guinea.

A total of 6 holes were drilled from Pad 1 for 272m, providing a good cross section through the Upper Zone. It was decided to terminate the program slightly early due to logistical difficulties and field durations. The drill rig belongs to Frontier and will remain onsite for future use.

A reconnaissance exploration program was also undertaken in the northern eastern sector of the soil grid where a consistent higher grade gold in soil anomaly is bordered by a zone of strong zinc and lead soil geochemistry. Additional information will be provided when the field data is compiled.

Field crew and drill core samples are being demobilised to Mt Hagen today and the samples will be transported to the laboratory in Lae later this week for processing and analysis.

It is anticipated that diamond drill core gold assays will be available for release in early December and subsequently a modest Rights Issue is anticipated to enable additional exploration and drilling of other targets in 2015.
